SECTION B: ANSWER SCRIPT

Q1. Explain the differences between Agile and Waterfall methodologies.

Agile methodology is iterative and incremental, focusing on collaboration and flexibility.

Waterfall is linear and sequential, moving through fixed phases (Requirements, Design, Code, Test, Deploy).

Q2. Detail the 5 phases of software design life cycle (SDLC).

1. Planning and Requirement Analysis: Gathering client inputs and defining milestones.
2. Defining Requirements: Writing Software Requirement Specifications (SRS) document.
3. Designing: Architects design database schemas, network topography, and module design.
4. Implementation or Coding: Developers write code matching design blueprints.
5. Testing: QA testers verify the product against original specifications.

Q3. Write short notes on database normalization.

Normalization is the process of organizing data in a database to reduce redundancy and improve integrity.

First Normal Form (1NF) requires atomic values and unique records.

Second Normal Form (2NF) removes partial dependencies.

Third Normal Form (3NF) removes transitive dependencies.
